

GHGA Intake Readiness Prototype

A minimal, transparent tool for dataset onboarding

Natalia Nenasheva

Interview - Data Steward / Bioinformatics

The full implementation is available on:

[ghga intake tool \(GitHub Repository\)](#)

Motivation

Archiving human genomics data requires more than storage:

- ▶ complete and valid metadata
- ▶ file integrity and traceability
- ▶ transparent intake decisions

This prototype simulates a realistic GHGA-style intake process.

What the tool does

The tool performs three main checks:

- ▶ Metadata validation (JSON Schema)
- ▶ File integrity checks (existence, size, MD5)
- ▶ Aggregation into a single intake report

Output:

- ▶ Machine-readable JSON report
- ▶ Human-readable Markdown summary

Readiness Score

A simple operational score to support intake decisions:

- ▶ **Metadata completeness** — 50%
- ▶ **File integrity** — 40%
- ▶ **QC placeholder** — 10%

The score supports prioritization.

The final **READY** / **NEEDS_FIX** status is rule-based.

Usability

The tool is packaged as a **CLI**:

```
PYTHONPATH=src python -m ghga_intake \  
  --manifest manifest.csv \  
  --metadata_dir metadata/ \  
  --schema schema.json
```

This reflects real-world archive workflows.

Why this matters for GHGA

- ▶ **Transparent and explainable** intake decisions
- ▶ **Clear feedback** to data providers
- ▶ **Extensible** for future policies (QC, access rules)
- ▶ **Aligns with FAIR** and archive best practices
